

WHAT MALAYSIANS SHOULD KNOW ABOUT ELECTRICITY GENERATION FUEL MIX

Natural gas used to be the dominant fuel for electricity generation in Peninsular Malaysia, accounting for two-thirds of the electricity generated. This over-dependence on single source of fuel has exposed the peninsula to the risk of power outage during gas supply disruption.

To ensure uninterrupted, reliable and cost-efficient electricity supply for the Nation, the government decided to diversify and balance out the generation fuel mix by bringing in coal and liquefied natural gas (LNG) into the matrix.

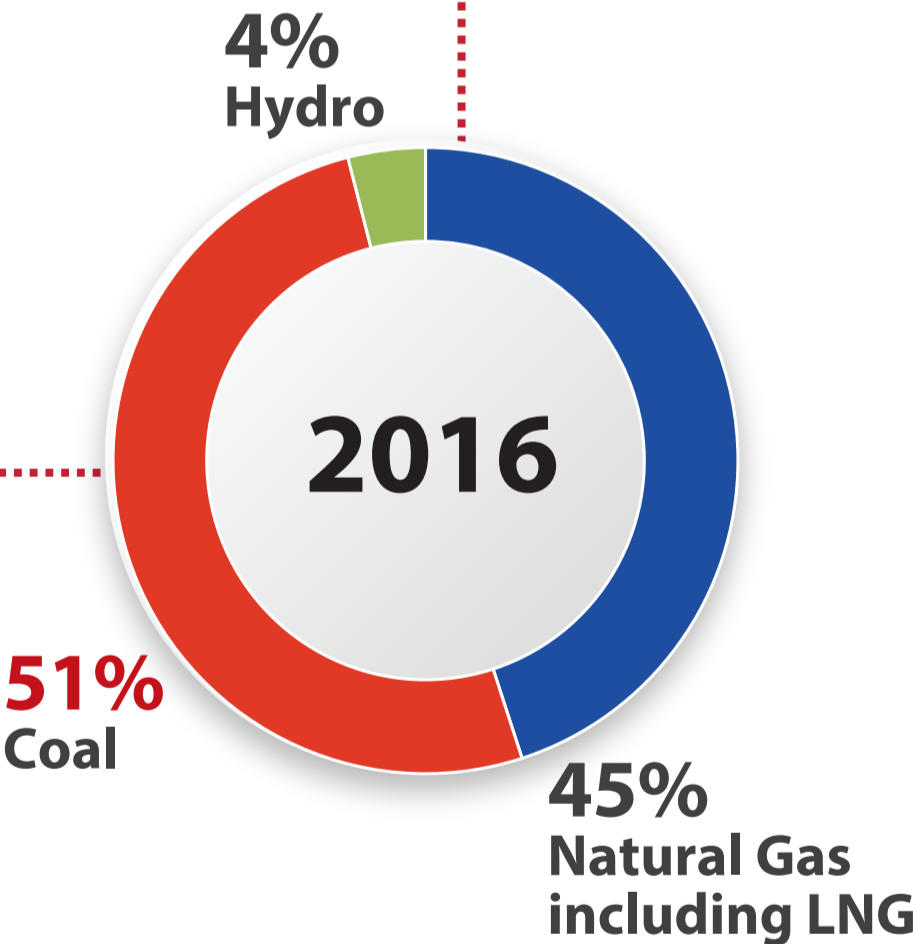

OUR PAST OVER-DEPENDENT

Natural gas represented more than 2/3 of the fuel mix for electricity generation.

OUR PRESENT DIVERSIFIED & BALANCED

A more robust fuel mix of 51% coal and 45% natural gas which includes LNG to generate electricity.

Benefits

- A reliable, sufficient and uninterrupted electricity supply.
- The cost of generating electricity from coal is lower compared to natural gas.
- Savings from fuel cost reductions amounting to **RM4.1 billion** is shared with customers in the form of rebates since 2015.
