SUPPORTING MALAYSIA'S ENERGY TRANSITION

PRO TEC SEALS DEAL WITH CHINA'S FAR EAST

This marks a new phase of collaboration aimed at value co-creation and long-term participation

KUALA LUMPUR

CHINA'S Far East Holdings Group has teamed up with Pro Tec Consolidation Sdn Bhd to support Malaysia's energy transition, grid modernisation and clean energy development.

The partnership, signed late last week here, will leverage Far East's global technology capabilities and Pro Tec's deep local execution strength.

It marks a new phase of collaboration aimed at value co-creation and long-term participation in Malaysia's power and energy infrastructure development,

the companies said.

Far East chief executive officer Maggie Chen said the cooperation aligns closely with the National Energy Transition Roadmap, Tenaga Nasional Bhd's (TNB) Grid of the Future strategy and the LTMS-PIP 2.0 framework for cross-border power interconnection within Asean.

Far East, which has over 40 years of experience in the global power and energy sector, provides end-to-end energy infrastructure solutions covering research and development, design, manufacturing and services.

Its product portfolio includes overhead conductors, power cables, submarine and special cables serving sectors such as smart grids, clean energy, transportation, infrastructure and digital communications.

The group's products and services are exported to over 160 countries and regions.

The group has participated in ultra-high voltage (UHV) and extra-high voltage (EHV) transmission projects, smart grid development, renewable energy pro-

jects, as well as data centre construction in Malaysia.

It is also active in energy storage systems and smart airport solutions.

Chen said the collaboration reflects strong confidence in Pro Tec's industry standing and local expertise.

As a long-standing core partner of TNB, Pro Tec has more than two decades of experience in Malaysia's power construction sector, project director Muhammad Zaini Abd Salim said.

Chen and Zaini said both parties will focus on three areas: supporting reliable grid construction through UHV and EHV transmission and cross-border interconnection; accelerating smart grid upgrades through digital and intelligent systems; and promoting microgrid, energy storage and photovoltaic solutions.

Far East said it is committed to complying with Malaysia's technical standards and market rules, while working closely with Pro Tec to ensure safe, stable and high-quality power grid operations.
