UPGRADING EXISTING INFRASTRUCTURE

ALLO TEAMS UP WITH JUNIPER NETWORKS

Partnership aims to meet demand for critical high-speed Internet connectivity

KUALA LUMPUR

ALLO Technology Sdn Bhd, a subsidiary of Tenaga Nasional Bhd, has selected US-based Juniper Networks Corporation to upgrade its existing network infrastructure to meet current and future demands for critical high-speed Internet connectivity, particularly in previously underserved communities.

Allo chief technology officer Muhammad Mohd Yunos said the company was excited to expand its partnership with Juniper Networks.

"As we continue to pave the way towards a fiberised nation, alongside Juniper Networks, we remain committed to creating connectivity which will enrich the lives of all Malaysians," he said in a statement yesterday.

Juniper Networks senior director (Asean and Taiwan) Perry Sui said it was a privilege to work with Allo Technology.

"By providing easily scalable network solutions, we are confident that we can help Allo enable innovation, deliver end-user experiences and achieve its goal in bringing world-class connectivity to the entire nation."

Allo has played a pivotal role in supporting MSC Malaysia by providing world-class fiberisation connectivity to Cyberjaya, a Special Economic Zone and ICT Hub.

The company is responsible for deploying the Cyberjaya Metro Fibre Network, Malaysia's first fully fibre-optic open access network, and was recently entrusted by the Malaysian government to implement the National Fiberisation and Connectivity Plan Pilot in Jasin, Melaka, under the National Broadband Initiative to enable nationwide broadband connectivity.

The country registered the highest growth in mobile data usage among neighbouring countries at a 35.2 per cent year-on-year growth in mobile data consumption between January last year and January this year.

To keep pace with the growing demand for high-speed connectivity, Allo has expanded its fiberisation coverage nationwide, targeting 180,000 premises by the end of this year.

Allo strengthened its network with Juniper Networks to further modernise its digital infrastructure by implementing the Juniper Networks MX480 Universal Routing Platforms.

With the country's Internet penetration rate at 84.2 per cent, these network upgrades will also enable Allo to scale its network nationwide efficiently, and better support the pace of cloud adoption and 5G capabilities across the country, in line with MyDIGITAL national initiatives to transform Malaysia's economy.

Juniper Networks Corporation's solutions can help Allo Technology Sdn Bhd reach its goal of a fiberised nation.
